

## CASE STUDY: TOPIC NUMBER 6

### Topic Name: Automated Deployment with Monitoring

- **Concepts Used:** Jenkins, EC2, Nagios.
- **Problem Statement:** "Set up a Jenkins CI/CD pipeline to deploy a simple web application on an EC2 instance. Configure Nagios to monitor the deployed application's availability."
- **Tasks:**
  - Create a Jenkins pipeline that builds and deploys a sample web app to an EC2 instance.
  - Install and configure Nagios to monitor the HTTP status of the deployed application.
  - Verify the pipeline by triggering a build and checking the monitoring status in Nagios.

## 1. Introduction

### Case Study Overview:

This case study focuses on creating an automated deployment and monitoring system using Jenkins, Amazon EC2, and Nagios. The primary goal is to set up a Jenkins CI/CD pipeline that automates the deployment of a simple web application on an EC2 instance. Additionally, Nagios is used to monitor the deployed application's availability, ensuring continuous functionality. This setup provides a robust solution for teams aiming to automate deployments while maintaining real-time monitoring.

### Key Feature and Application:

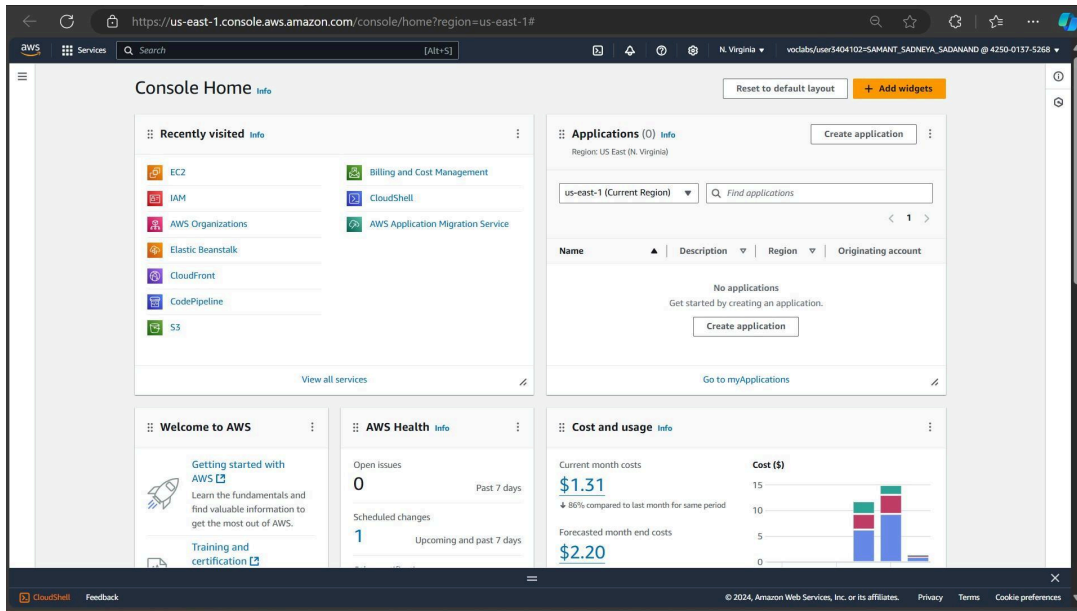

The unique aspect of this case study is the integration of Jenkins with a CI/CD pipeline, which allows for automated builds, testing, and deployment. This automation reduces manual intervention, leading to a more efficient deployment process. By combining it with Nagios for monitoring, the solution ensures the deployed application remains accessible and responsive. This setup is ideal for dynamic environments where frequent updates and deployments are necessary, such as agile development teams or small-scale applications.

## 2. Step-by-Step Explanation:

### 1. Installing Jenkins on AWS EC2

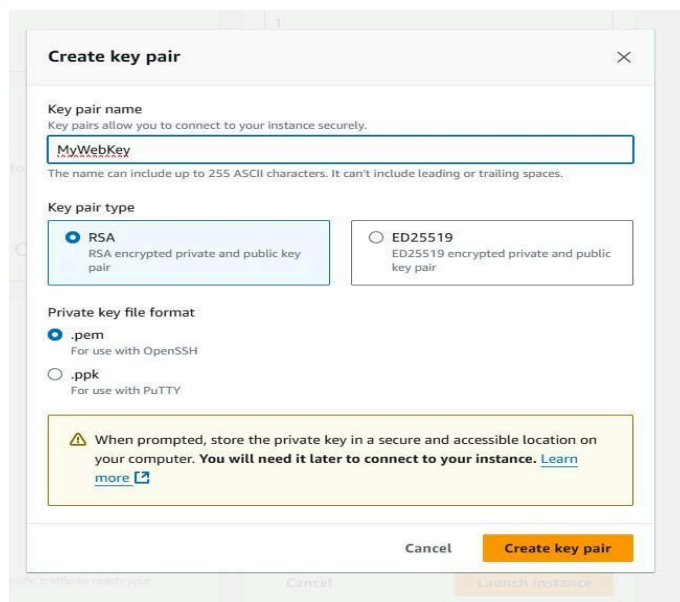

#### Prerequisites

1. **AWS Account:** Sign up for an AWS account if you don't have one.

## Step 1: Create a Key Pair

1. **Open the EC2 Console:** Go to the [Amazon EC2 console](#).
2. **Key Pairs:** In the navigation pane, under **NETWORK & SECURITY**, select **Key Pairs**.
3. **Create Key Pair:**
  - Click **Create key pair**. Here, I have created “MyWebKey.pem”.
  - Name the key pair and select **pem** for **File format**.

- Click **Create key pair** to download the private key file. **Store it securely.**
4. **Set Permissions:** `chmod 400 /path/to/your-key-pair.pem`

## Step 2: Create a Security Group

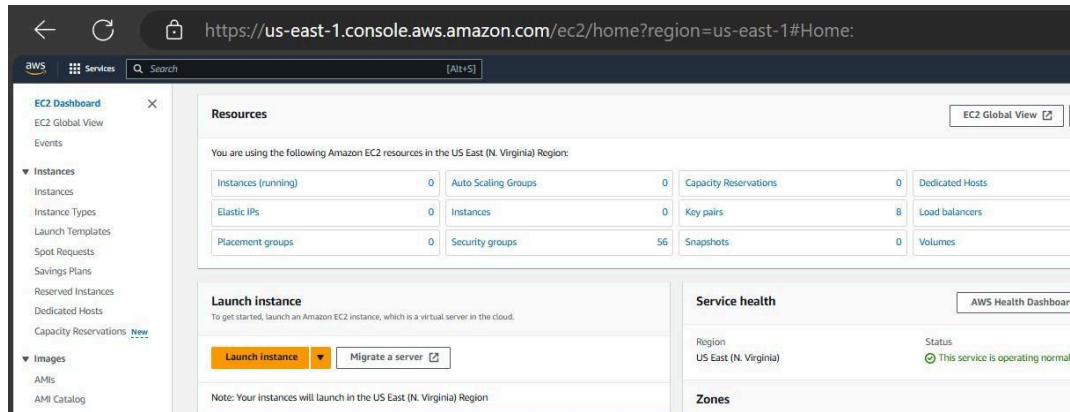

1. **Security Groups:** In the EC2 console, select **Security Groups** and then **Create Security Group**.
2. **Configure Rules:**
  - **Name:** Enter a name. Here I have given name “WebserverSG”
  - **Description:** Provide a description. (optional)
  - **Inbound Rules:**
    - **SSH:** Allow inbound SSH from your IP.
      - Type: SSH
      - Source: Your public IP with /32 (e.g., 103.87.55.26/32).
    - **HTTP:** Allow inbound HTTP from anywhere.
      - Type: HTTP
      - Source: 0.0.0.0/0
    - **Custom TCP Rule:** Allow Jenkins (8080) access.
      - Type: Custom TCP Rule
      - Port Range: 8080
      - Source: 0.0.0.0/0 (or restrict to your IP).
    - **Custom TCP Rule:** Allow Jenkins TCP (50000) for agent access. you will see its use later.
      - Type: Custom TCP Rule
      - Port Range: 50000
      - Source: 0.0.0.0/0 (or restrict to your IP).
3. Click on Create the Security Group.

The screenshot shows the AWS Management Console interface for a security group named 'sg-0d700e7a9980460fc - WebServerSG'. The 'Details' section shows the security group ID, owner (425001375268), and description ('this is web server security group'). The 'Inbound rules' section shows four rules:

Name	Security group rule...	IP version	Type	Protocol	Port range	Source	Description
-	sg-0711e4b6a3604...	IPv4	Custom TCP	TCP	50000	0.0.0.0/0	-
-	sg-0007f4ed116b27fa3	IPv4	SSH	TCP	22	103.87.55.26/32	-
-	sg-05a49c569f976caaa	IPv4	HTTP	TCP	80	0.0.0.0/0	-
-	sg-0d28fb4c7bc83df6b	IPv4	Custom TCP	TCP	8080	0.0.0.0/0	-

## Step 3: Launch an EC2 Instance

1. **Launch Instance:** In the EC2 dashboard, click **Launch Instance**.

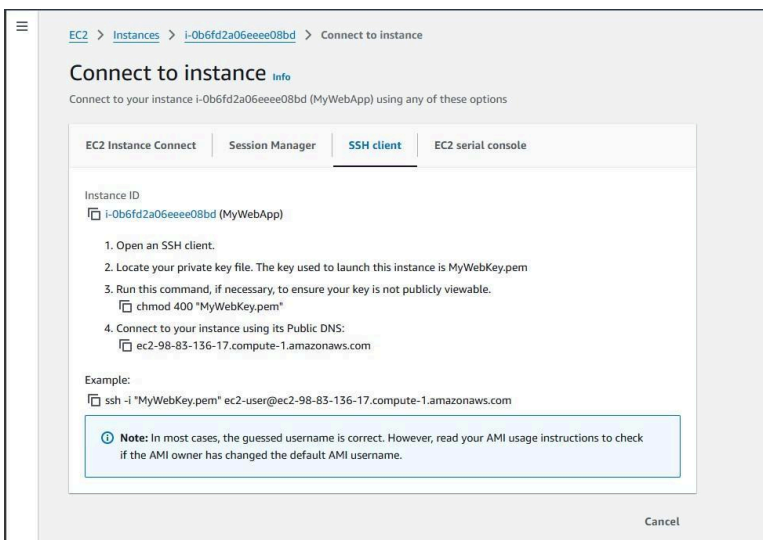

2. **Choose AMI:** Select the Amazon Linux 2023 AMI (Free tier eligible).
3. **Instance Type:** Choose t2.micro (Free tier eligible).
4. **Configure Instance:**
  - **Key Pair:** Select the key pair you created.(MyWebKey)
  - **Security Group:** Select the security group (JenkinsSG) you just created.
5. **Launch:** Review and click **Launch Instance**.
6. **Check Status:** Go to **Instances** in the navigation pane to monitor the instance status. Wait until it shows running. Thus Instance created successfully.

#### Step 4: Connect to Your EC2 Instance

1. **Get Public DNS:** Select the instance and find the **Public DNS (IPv4)**. Now open your command prompt.

**Connect via SSH:** `ssh -i /path/to/your-key-pair.pem ec2-user@your-instance-public-dns`

```

[ec2-user@ip-172-31-40-207 ~]$
```

## Step 5: Install Jenkins

- ### 1. Update Packages:

```
sudo yum update -y
```

```

[ec2-user@ip-172-31-40-207 ~]$ sudo yum update
Last metadata expiration check: 0:05:20 ago on Sat Oct 19 13:33:03 2024.
Dependencies resolved.
Nothing to do.
Complete!

```

- ## 2. Add Jenkins Repository:

```
sudo wget -O /etc/yum.repos.d/jenkins.repo https://pkg.jenkins.io/redhat-stable/jenkins.repo
```

```
[ec2-user@ip-172-31-40-207 ~]$ sudo wget -O /etc/yum.repos.d/jenkins.repo \
https://pkg.jenkins.io/redhat-stable/jenkins.repo
--2024-10-19 14:28:06-- https://pkg.jenkins.io/redhat-stable/jenkins.repo
Resolving pkg.jenkins.io (pkg.jenkins.io)... 146.75.38.133, 2a04:4e42:79::645
Connecting to pkg.jenkins.io (pkg.jenkins.io)|146.75.38.133|:443
... connected.
HTTP request sent, awaiting response... 200 OK
Length: 85
Saving to: '/etc/yum.repos.d/jenkins.repo'

/etc/yum.repos.d/jenkins.repo 100%[=====] 85 --.-KB/s in 0s

2024-10-19 14:28:06 (9.62 MB/s) - '/etc/yum.repos.d/jenkins.repo'
saved [85/85]
```

3. **Import Jenkins Key:**

```
sudo rpm --import https://pkg.jenkins.io/redhat-stable/jenkins.io-2023.key
```

```
[ec2-user@ip-172-31-40-207 ~]$ sudo rpm --import https://pkg.jenkins.io/redhat-stable/jenkins.io-2023.key
```

Also check any upgradation and upgrade.

```
[ec2-user@ip-172-31-40-207 ~]$ sudo yum upgrade
Jenkins-stable          331 kB/s | 29 kB      00:00
Dependencies resolved.
Nothing to do.
Complete!
```

4. **Install Java (Jenkins requires Java):** `sudo dnf install java-17-amazon-corretto -y`

```
[ec2-user@ip-172-31-40-207 ~]$ sudo dnf install java-17-amazon-corretto -y
Last metadata expiration check: 0:00:17 ago on Sat Oct 19 14:28:31 2024.
Dependencies resolved.

```

##### 6. Enable and Start Jenkins:

```
sudo systemctl enable jenkins
```

```

[ec2-user@ip-172-31-40-207 ~]$ sudo systemctl enable jenkins
Created symlink /etc/systemd/system/multi-user.target.wants/jenkins.service → /usr/lib/systemd/system/jenkins.service.

```

```
sudo systemctl start jenkins
```

## 7. Check Jenkins Status:

```
sudo systemctl status
```

```
jenkins
```

```
[ec2-user@ip-172-31-40-207 ~]$ sudo systemctl start jenkins
[ec2-user@ip-172-31-40-207 ~]$ sudo systemctl status jenkins
● jenkins.service - Jenkins Continuous Integration Server
   Loaded: loaded (/usr/lib/systemd/system/jenkins.service; e>
   Active: active (running) since Sat 2024-10-19 14:30:01 UTC>
   Main PID: 74158 (java)
     Tasks: 46 (limit: 1112)

lines 1-20/20 (END)
```

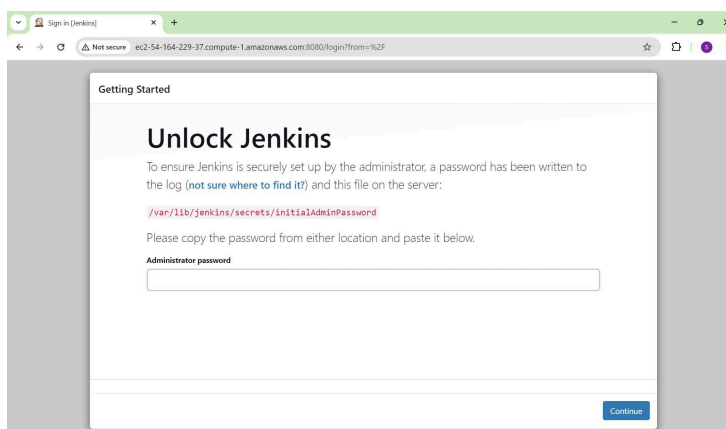

## Step 6: Configure Jenkins

1. **Access Jenkins:** Open your web browser and go to browser and type `http://<your_instance_public_dns>:8080`

← ↻ 🌐 <http://ec2-54-164-229-37.compute-1.amazonaws.com:8080>

## 2. Unlock Jenkins:

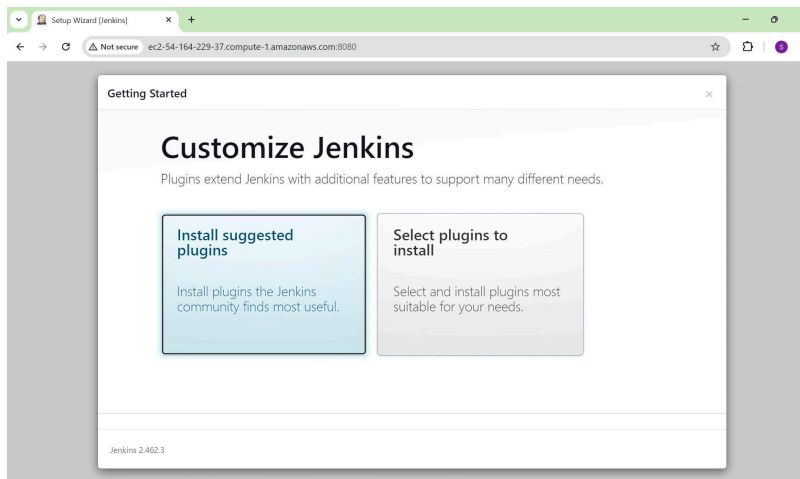

Find the initial admin password:

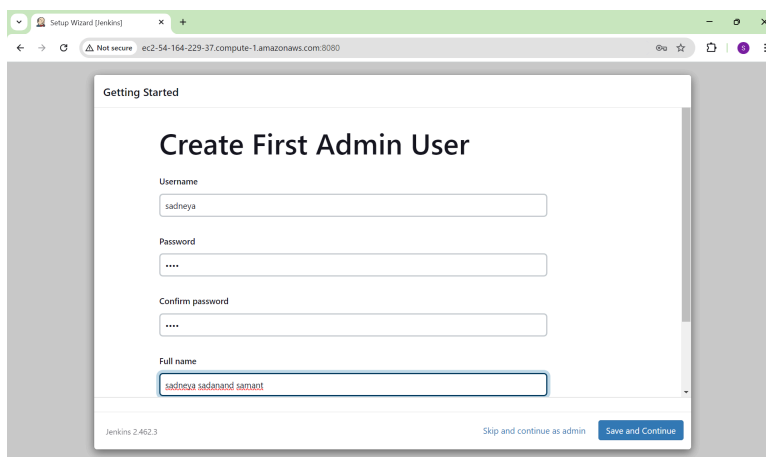

```
sudo cat /var/lib/jenkins/secrets/initialAdminPassword
```

```
[ec2-user@ip-172-31-45-86 ~]$ sudo cat /var/lib/jenkins/secrets/initialAdminPassword  
da0e63b6884a46359abe8e3a364f7c22
```

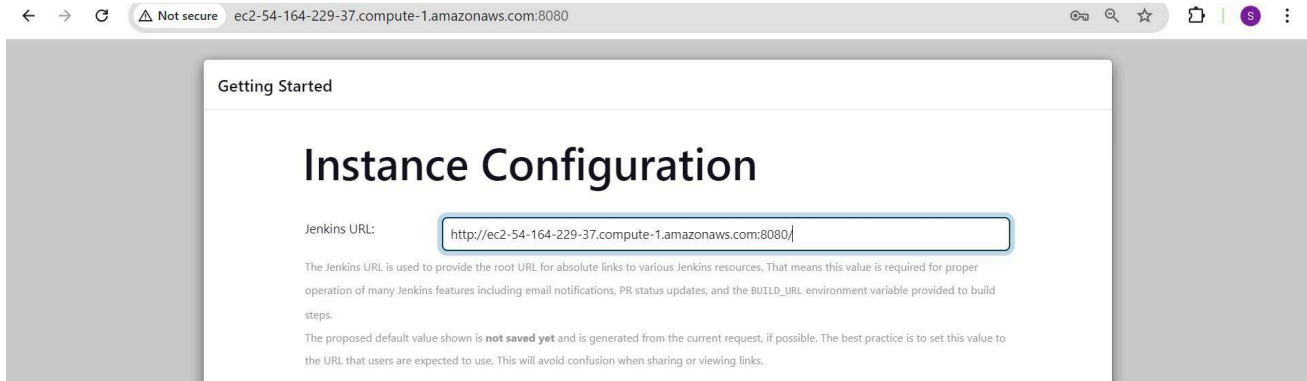

- Copy the password and paste it into the web interface to unlock Jenkins.
3. **Customize Jenkins:** Follow the setup wizard to install suggested plugins and create an admin user.

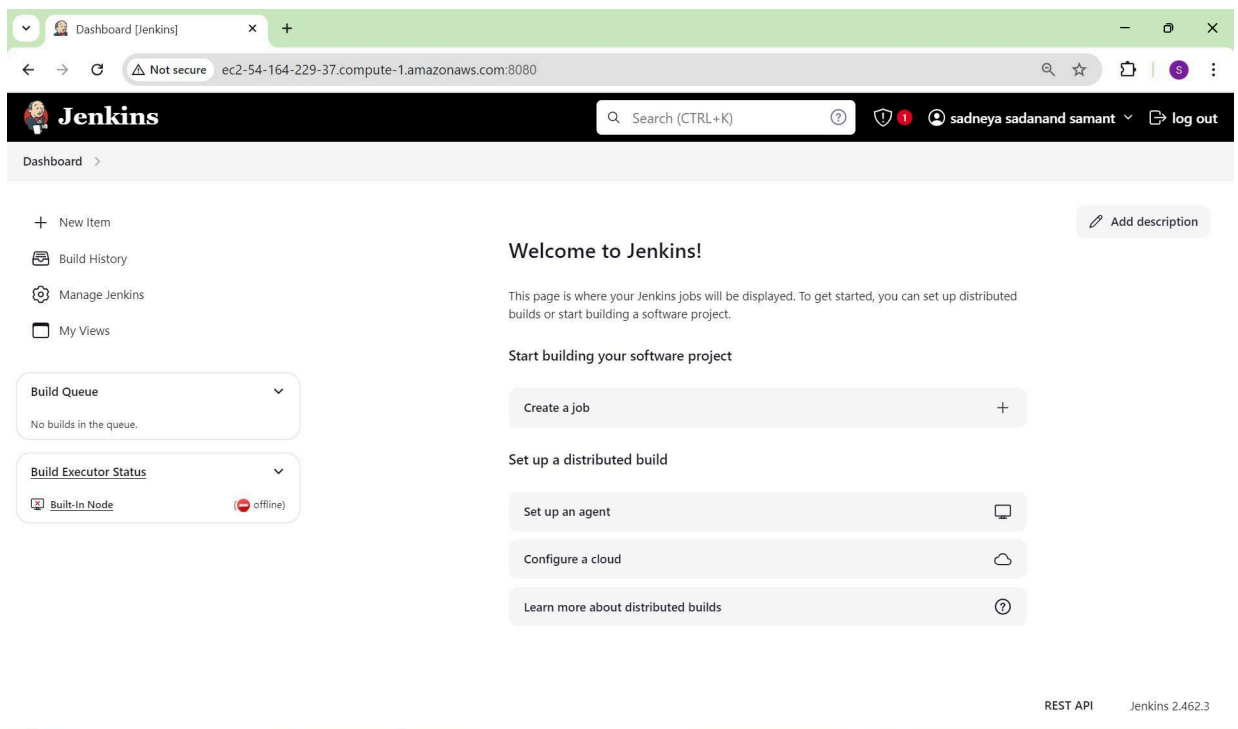

4. set username, password and full name.

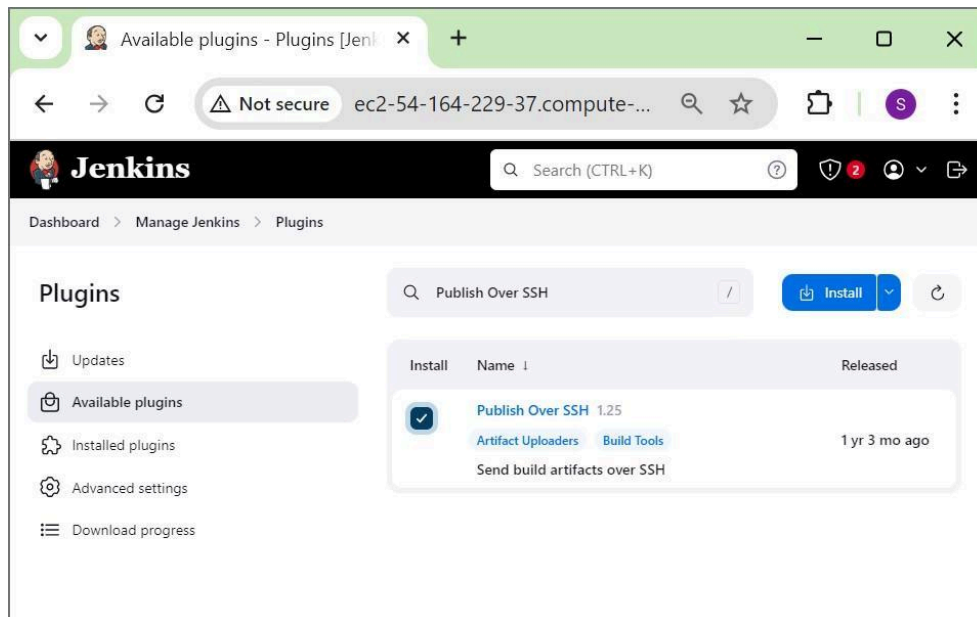

5. **Finish Setup:** Once configured, Jenkins will be accessible at `http://<your_instance_public_dns>:8080`.

Thus click on finish jenkins will open.

## 6. Install publish over ssh

## 7. Go to Manage Jenkins-&gt;credentials create a global credential for ssh.

**1.Add kind: SSH****2. Scope: Global****3.ID:** assign Id here i have given myEC2SSH**4.Username:** ec2-user for amazon linux**5.private key:** give the key which we created on creating an instance.

## New credentials

Kind  
SSH Username with private key

Scope  
Global (Jenkins, nodes, items, all child items, etc)

ID  
myEC2SSHkey

Description  
EC2 SSH key

Username  
ec2-user

☐ Treat username as secret

Private Key  
☒ Enter directly

Key  
Enter New Secret Below  
-----BEGIN RSA PRIVATE KEY-----  
MIIEOwIBAAKCAQEAvgvSj6R6XyGUR/RpS2Nk9H00Z36C5/1gUP/tYUd+Oup+YDxD  
/CUJv/1xG21Kd8X/Yz2IPKkKw3NMK511V88xAGH+uA8T0063T0Sns9V135Vg

Passphrase

Create

8. 1. Go to manage jenkins then scroll down there you will get publish over ssh section there copy paster your key and

Publish over SSH

Test Configuration

9. 1. As my built-in-node have limited space thus i need to use master-slave architecture. here I have created a node named "laptop\_node"

#### New node

Node name

laptop\_node

Type

☒ Permanent Agent

Adds a plain, permanent agent to Jenkins. This is called "permanent" because Jenkins doesn't provide higher level of integration with these agents, such as dynamic provisioning. Select this type if no other agent types apply — for example such as when you are adding a physical computer, virtual machines managed outside Jenkins, etc.

Create

Name ?

laptop\_node

Description ?

this is second node

Thus at final it gives output connected.

10.

1. Create a pipeline here i have created pipeline name MyWebApp

1. Deploy your code in the pipeline you created

```
before pipeline {  
    agent any  
  
    environment {  
        EC2_USER = 'ec2-user' // Your EC2 user  
        EC2_IP = '54.162.136.27' // Your EC2 public IP address without trailing slash  
        SSH_KEY = credentials('myEC2SSHKey') // Your Jenkins credential ID for SSH  
    }  
  
    stages {  
        stage('Checkout') {  
            steps {  
                script {  
                    git branch: 'main', url: 'https://github.com/VedangWajge/Leafing-copy.git'  
                }  
            }  
        }  
  
        stage('Clean Previous Installations') {  
            steps {  
                script {  
                    dir('frontend') {  
                        if (fileExists('node_modules')) {  
                            bat 'rmdir /s /q node_modules'  
                        }  
                        if (fileExists('package-lock.json')) {

                    }  
                }  
            }  
        }  
  
        stage('Install Frontend Dependencies') {  
            steps {  
                script {  
                    try {  
                        dir('frontend') {  
                            bat 'npm install'  
                        }  
                    } catch (Exception e) {  
                        error "Dependency installation failed: ${e.message}"  
                    }  
                }  
            }  
        }  
    }  
}
```

```

    }
  }
}

stage('Build Frontend') {
  steps {
    script {
      dir('frontend') {
        try {
          bat 'npm run build'
        } catch (Exception e) {
          error "Frontend build failed: ${e.message}"
        }
      }
    }
  }
}

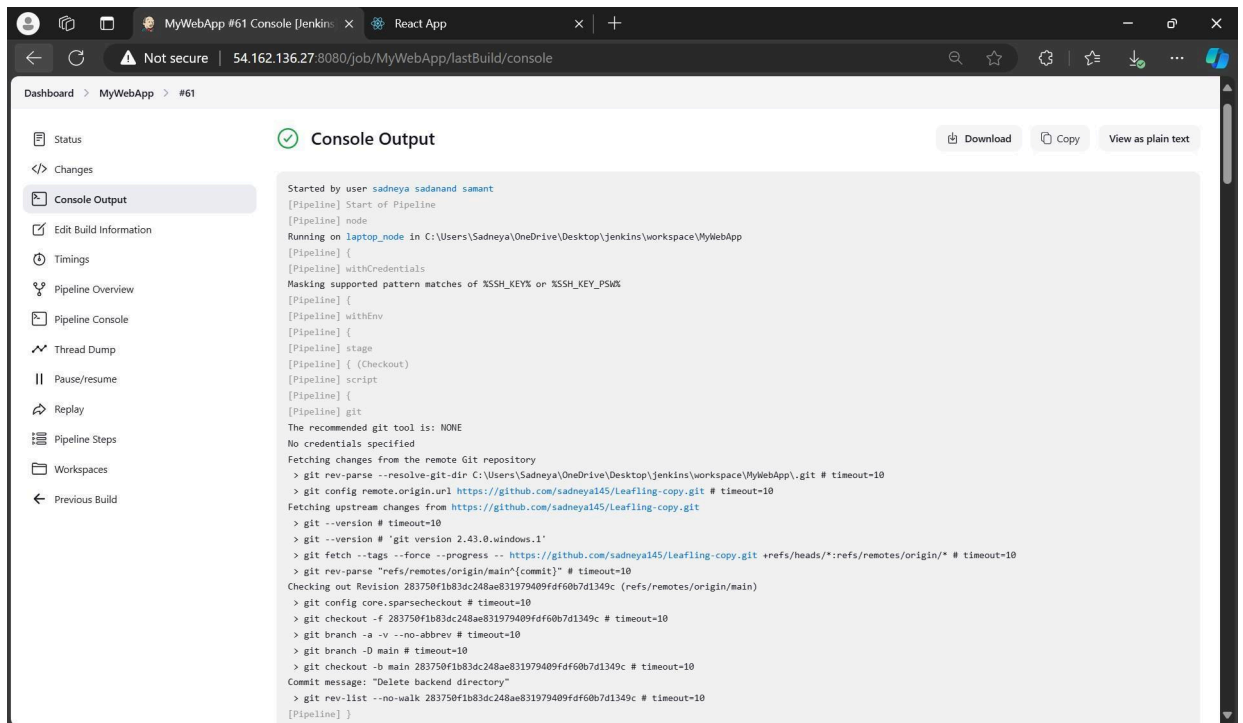

stage('Deploy to EC2')
{ steps {
  script {
    // Create the target directory on EC2 and copy frontend build files
    bat """
      ssh -i C:\\Users\\Vedang\\Downloads\\MyWebKey.pem -o
StrictHostKeyChecking=no ${EC2_USER}@${EC2_IP} "mkdir -p /home/ec2-user/myapp"
      scp -i C:\\Users\\Vedang\\Downloads\\MyWebKey.pem -o
StrictHostKeyChecking=no -r frontend\\build\\*
${EC2_USER}@${EC2_IP}:/home/ec2-user/myapp/
      """
  }
}
}

post {
  success {
    echo 'Frontend deployment successful!'
  }
  failure {
    echo 'Frontend deployment failed. Check logs for more details.'
  }
}
}

```

Then after build the output will be:

The screenshot shows the Jenkins web interface for a pipeline named 'MyWebApp'. The 'Console Output' tab is selected, displaying the execution log. The log starts with 'Started by user sadneya sadanand samant' and shows the pipeline starting at 'node'. It runs on 'laptop\_node' in the directory 'C:\Users\Sadneya\OneDrive\Desktop\jenkins\workspace\MyWebApp'. The log includes several '[Pipeline]' markers and shows the execution of a 'script' stage. The script performs a series of git operations: fetching changes, checking out a specific revision, and creating a new branch. The log ends with 'Finished: SUCCESS'.

```
sudo passwd nagios
```

```
[ec2-user@ip-172-31-40-207 ~]$ sudo adduser -m nagios
sudo passwd nagios
Changing password for user nagios.
New password:
BAD PASSWORD: The password is shorter than 8 characters
Retype new password:
passwd: all authentication tokens updated successfully.
```

#### 4. Create a New User Group:

```
sudo groupadd nagcmd
```

#### 5. Modify User Groups:

```
sudo usermod -a -G nagcmd nagios
```

```
sudo usermod -a -G nagcmd apache
```

```
[ec2-user@ip-172-31-40-207 ~]$ sudo groupadd nagcmd
[ec2-user@ip-172-31-40-207 ~]$ sudo usermod -a -G nagcmd nagios
sudo usermod -a -G nagcmd apache
```

#### 6. Setting Up Nagios

Create a Directory for Nagios Downloads:

```
mkdir ~/downloads
```

```
cd ~/downloads
```

```
[ec2-user@ip-172-31-40-207 ~]$ mkdir ~/downloads
cd ~/downloads
```

#### 7. Download Nagios Source Files:

wget <https://go.nagios.org/l/975333/2024-09-17/6kqcx>

```
[ec2-user@ip-172-31-40-207 downloads]$ wget https://go.nagios.org/l/975333/2024-09-17/6kqcx

```

**9. Unzip the Nagios Source Files:**

tar zxvf 6kqcx

```
[ec2-user@ip-172-31-40-207 downloads]$ tar zxvf 6kqcx
nagios-4.5.5/
nagios-4.5.5/.github/
nagios-4.5.5/.github/workflows/
nagios-4.5.5/.github/workflows/test.yml
nagios-4.5.5/.gitignore
```

cd nagios-4.5.5

```
[ec2-user@ip-172-31-40-207 downloads]$ cd nagios-4.5.5
```

**10. Run Configuration Script:**

```
./configure --with-command-group=nagcmd
```

```
[ec2-user@ip-172-31-40-207 nagios-4.5.5]$ ./configure --with-command-group=nagcmd

*** Configuration summary for nagios 4.5.5 2024-09-17 ***:

General Options:
-----
Nagios executable: nagios
Nagios user/group: nagios,nagios
Command user/group: nagios,nagcmd
Event Broker: yes
Install ${prefix}: /usr/local/nagios
Install ${includedir}: /usr/local/nagios/include/nagios
Lock file: /run/nagios.lock
Check result directory: /usr/local/nagios/var/spool/checkresults
Init directory: /lib/systemd/system
Apache conf.d directory: /etc/httpd/conf.d
Mail program: /bin/mail
Host OS: linux-gnu
IOBroker Method: epoll

Web Interface Options:
-----
HTML URL: http://localhost/nagios/
CGI URL: http://localhost/nagios/cgi-bin/
Traceroute (used by WAP): /usr/bin/traceroute

Review the options above for accuracy. If they look okay,
type 'make all' to compile the main program and CGIs.
```

### 13. Install Nagios:

```
sudo make install
sudo make
install-init
sudo make install-config
sudo make install-commandmode
```

```
[ec2-user@ip-172-31-40-207 nagios-4.5.5]$ sudo make install
sudo make install-init
sudo make install-config
sudo make install-commandmode
```

```
ec2-user@ip-172-31-40-207:~$ sudo make install

*** Compile finished ***

If the main program and CGIs compiled without any errors, you
can continue with testing or installing Nagios as follows (type
'make' without any arguments for a list of all possible options):

make test
- This runs the test suite

make install
- This installs the main program, CGIs, and HTML files

make install-init
- This installs the init script in /lib/systemd/system

make install-daemoninit
- This will initialize the init script
  in /lib/systemd/system

make install-groups-users
- This adds the users and groups if they do not exist

make install-commandmode
- This installs and configures permissions on the
  directory for holding the external command file
```

```

*** Main program, CGIs and HTML files installed ***

You can continue with installing Nagios as follows (type 'make'
without any arguments for a list of all possible options):

    make install-init
        - This installs the init script in /lib/systemd/system

    make install-commandmode
        - This installs and configures permissions on the
          directory for holding the external command file

    make install-config
        - This installs sample config files in /usr/local/nagios/etc

```

#### 14. Configure Nagios Web Interface:

sudo make install-webconf

```

[ec2-user@ip-172-31-40-207 nagios-4.5.5]$ sudo make install-webconf
/usr/bin/install -c -m 644 sample-config/httpd.conf /etc/httpd/conf.d/nagios.conf
if [ 0 -eq 1 ]; then \
    ln -s /etc/httpd/conf.d/nagios.conf /etc/apache2/sites-enabled/nagios.conf; \
fi

*** Nagios/Apache conf file installed ***

```

#### 15. Create Nagios Admin Account:

sudo htpasswd -c /usr/local/nagios/etc/htpasswd.users nagiosadmin

```

[ec2-user@ip-172-31-40-207 nagios-4.5.5]$ sudo htpasswd -c /usr/local/nagios/etc/htpasswd.users nagiosadmin
New password:
Re-type new password:
Adding password for user nagiosadmin

```

#### 16. Restart Apache:

sudo service httpd restart

```

[ec2-user@ip-172-31-40-207 nagios-4.5.5]$ sudo service httpd restart
Redirecting to /bin/systemctl restart httpd.service
[ec2-user@ip-172-31-40-207 nagios-4.5.5]$ sudo chkconfig --add nagios
error reading information on service nagios: No such file or directory

```

#### 17. Unzip Nagios Plugins:

cd ~/downloads

tar zxvf nagios-plugins-2.0.3.tar.gz

cd nagios-plugins-2.0.3

```

[ec2-user@ip-172-31-40-207 nagios-4.5.5]$ cd ~/downloads
[ec2-user@ip-172-31-40-207 downloads]$ tar zxvf nagios-plugins-2.0.3.tar.gz

```

21. **Get Public IP Address:** Go back to the EC2 Console and copy the public IP address of your instance.
22. **Access Nagios Web Interface:** Open your web browser and navigate to: `http://<your_public_ip_address>/nagios`

Enter the username (nagiosadmin) and the password you set in Step 15.

## Making Changes for application in Nagios

### 1. Goto configurations file

```
[ec2-user@ip-172-31-45-86 ~]$ sudo nano /usr/local/nagios/etc/nagios.cfg
```

Add the file which we are newly creating for monitoring of our application

cfg\_file=/usr/local/nagios/etc/objects/myweb.cfg add this

```
log_file=/usr/local/nagios/var/nagios.log

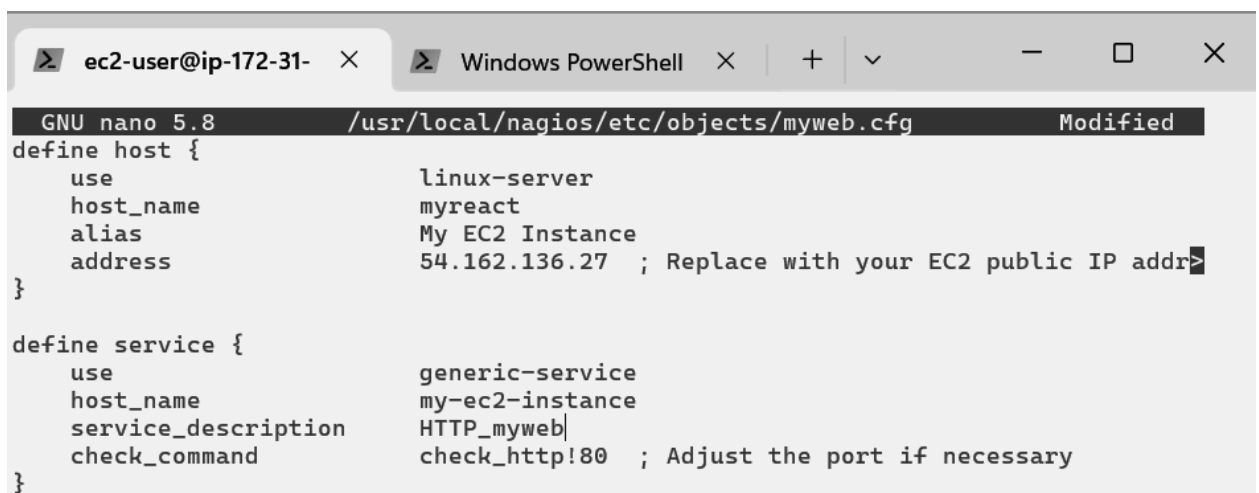

# OBJECT CONFIGURATION FILE(S)
# These are the object configuration files in which you define hosts,
# host groups, contacts, contact groups, services, etc.
# You can split your object definitions across several config files
# if you wish (as shown below), or keep them all in a single config file.

# You can specify individual object config files as shown below:
cfg_file=/usr/local/nagios/etc/objects/commands.cfg
cfg_file=/usr/local/nagios/etc/objects/contacts.cfg
cfg_file=/usr/local/nagios/etc/objects/timeperiods.cfg
cfg_file=/usr/local/nagios/etc/objects/templates.cfg
cfg_file=/usr/local/nagios/etc/objects/myec2.cfg
# Definitions for monitoring the local (Linux) host
cfg_file=/usr/local/nagios/etc/objects/myweb.cfg
cfg_file=/usr/local/nagios/etc/objects/localhost.cfg
```

### 2. .write inside that file the required information

sudo nano /usr/local/nagios/etc/objects/myweb.cfg

```
[ec2-user@ip-172-31-45-86 backend]$ sudo nano /usr/local/nagios/etc/objects/myweb.cfg
```

```
GNU nano 5.8 /usr/local/nagios/etc/objects/myweb.cfg Modified
define host {
    use                linux-server
    host_name          myreact
    alias              My EC2 Instance
    address            54.162.136.27 ; Replace with your EC2 public IP address
}

define service {
    use                generic-service
    host_name          my-ec2-instance
    service_description HTTP_myweb
    check_command      check_http!80 ; Adjust the port if necessary
}
```

3. **Again Verify the changes by :** `sudo /usr/local/nagios/bin/nagios -v /usr/local/nagios/etc/nagios.cfg`

```
[ec2-user@ip-172-31-45-86 backend]$ sudo /usr/local/nagios/bin/nagios -v /usr/local/nagios/etc/nagios.cfg

5. **Go to commands file** there make changes in `check_http` section

Add -> command line /usr/local/nagios/libexec/check\_http -H \$HOSTADDRESS\$ -p \$ARG1\$ \$ARG2\$

```
define command {
    command_name    check_snmp
    command_line    $USER1$/check_snmp -H $HOSTADDRESS$ $ARG1$
}

define command {
    command_name    check_http
    # command_line    $USER1$/check_http -I $HOSTADDRESS$ $ARG1$
    command_line    /usr/local/nagios/libexec/check_http -H $HOSTADDRESS$ -p $ARG1$ $ARG2$
}

define command {
```

**Left Sidebar Navigation:**  
 General: Home, Documentation  
 Current Status: Tactical Overview, Map (Legacy), Hosts, Services, Host Groups (Summary, Grid), Service Groups (Summary, Grid), Problems (Services (Unhandeled), Hosts (Unhandeled), Network Outages)  
 Reports: Availability, Trends (Legacy), Alerts (History, Summary), Histogram (Legacy), Notifications, Event Log

Go to host section present on left sidebar and click on “my-ec2-intsance” it will give host information.

The screenshot shows the Nagios web interface for host 'My EC2 Instance (myreact)' at IP 54.162.136.27. The interface includes a sidebar with navigation links like General, Current Status, Tactical Overview, and Reports. The main content area displays 'Host Information' (last updated, Nagios version, etc.), 'Host State Information' (UP status, performance data, check latency, etc.), and 'Host Commands' (a list of actions like 'Disable active checks' or 'Schedule downtime'). A 'Host Comments' section at the bottom shows no comments.

Now click on services on left sidebar you will get detailed information about network status.

The screenshot shows the 'Service Status Details For All Hosts' page in Nagios. It displays a table of services for hosts 'localhost' and 'my-ec2-instance'. The table columns include Host, Service, Status, Last Check, Duration, Attempt, and Status Information. Services like 'Current Load', 'Current Users', 'HTTP', 'Jenkins Monitoring', 'PING', 'Root Partition', 'SSH', 'Swap Usage', 'Total Processes', and 'HTTP\_myweb' are listed. The status of each service is indicated by a color-coded icon (green for OK, red for CRITICAL, yellow for UNKNOWN, etc.). The status information column provides detailed error messages or metrics for each service.

## Conclusion

This case study involved setting up an automated CI/CD pipeline with Jenkins to deploy a web app on AWS EC2, and using Nagios for monitoring. We faced challenges like SSH configuration, limited Jenkins disk space, and SSL issues with Nagios, which were resolved through security adjustments and required package installations. Key takeaways included the importance of secure automation and effective monitoring for maintaining a reliable deployment process.
